Introduction to Databases and DBMSs

Lesson 4: Non-Procedural Access

Lesson Objectives

- Discuss the importance of non-procedural access
- Explain the link between the five types of application development tools and nonprocedural access

Nonprocedural Database Access

- Query: request for data to answer a question
- Indicate what parts of database to retrieve not the procedural details
- Improve productivity and improve accessibility
- SQL SELECT statement and graphical tools

SELECT Statement Execution

The screenshot displays a database query tool interface. The top toolbar contains various icons for execution, saving, and editing. Below the toolbar, the 'Query Builder' tab is active, showing a SQL query in a text editor. The query is a SELECT statement that joins the 'Offering' and 'Faculty' tables, filtering for the Fall 2016 term, Assistant rank, and courses starting with 'IS'. The 'Script Output' and 'Query Result' tabs are visible at the bottom. The 'Query Result' tab shows the execution status and a table of results with two rows.

```
SELECT OfferNo, CourseNo, FacFirstName, FacLastName
FROM Offering INNER JOIN Faculty
ON Faculty.FacNo = Offering.FacNo
WHERE OffTerm = 'FALL' AND OffYear = 2016
AND FacRank = 'ASST' AND CourseNo LIKE 'IS%';
```

Procedural Language Interface

- Combine procedural language with nonprocedural access
- Why
 - Batch processing
 - Customization (especially for ecommerce) and automation
 - Performance improvement

Summary

- Database technology vital to modern organizations
- Crucial DBMS feature: nonprocedural access
- Query language, visual tool, form tool, report tool, and embedding
- Fundamental skill: query formulation
